

### KOOT BOXES CHANGER

A Koot boxes changer is standard equipped with a logic controller, which counts the number of shots produced by means of a signal from the injection molding machine. As soon as the set number of shots is reached, the boxes changer will rotate one position.

The boxes changer has a capacity of approx. 24 boxes in standard design. This system will automatically change at the achieved number of shots. The boxes can be filled with the robot mounted on top of your injection molding machine. The number of products in the box is good to ensure that the robot products dropped in the box.

The control system is easily adjustable for different box quantities and the desired number of shots.
